

Human parainfluenza virus 3

VR-1782™

Description

Human parainfluenza virus 3 strain ATCC-2011-5 is propagated in LLC-MK2 Derivative cells (ATCC CCL-7.1). This virus was isolated in 2011 from a clinical sample from a patient positive for PIV 3 in Virginia. It has applications in respiratory disease research.

Strain designation: ATCC-2011-5

Storage Conditions

Product format: Frozen

Storage conditions: -70°C or colder

Intended Use

This product is intended for laboratory research use only. It is not intended for any animal or human therapeutic use, any human or animal consumption, or any diagnostic use.

BSL 2

ATCC determines the biosafety level of a material based on our risk assessment as guided by the current edition of *Biosafety in Microbiological and Biomedical Laboratories (BMBL)*, U.S. Department of Health and Human Services. It is your responsibility to understand the hazards associated with the material per your organization's policies and procedures as well as any other applicable regulations as enforced by your local or national agencies.

ATCC highly recommends that appropriate personal protective equipment is always used when handling vials. For cultures that require storage in liquid nitrogen, it is important to note that some vials may leak when submersed in liquid nitrogen and will slowly fill with liquid nitrogen. Upon thawing, the conversion of the liquid nitrogen back to its gas phase may result in the vial exploding or blowing off its cap with dangerous force creating flying debris. Unless necessary, ATCC recommends that these cultures be stored in the vapor phase of liquid nitrogen rather than submersed in liquid nitrogen.

Certificate of Analysis

For batch-specific test results, refer to the applicable certificate of analysis that can be found at www.atcc.org.

Growth Conditions

Host: LLC-MK2 Derivative (ATCC CCL-7.1)

Effects: CPE; cell rounding

Temperature: 35°C

Atmosphere: 95% Air, 5% CO₂

Recommendations for infection: Plate cells 24-48 hours in advance and infect when cultures are 80-90% confluent. Remove medium, rinse with plain Virus growth medium: EMEM, and inoculate with a small volume (e.g. 1 mL per 25 cm²) of virus diluted to provide a MOI of about 0.1. Adsorb 1-2 hours at 35°C in a humidified 5% CO₂ atmosphere, rocking every 15-20 minutes to redistribute inoculum. End adsorption by adding virus growth medium.

Incubation: 9-14 days in a humidified 5% CO₂ atmosphere

Human parainfluenza virus 3

VR-1782

Handling Procedures

Mycoplasma contamination: Not detected

Notes

Key Abbreviations: °C, Degrees Celsius; CO₂, Carbon dioxide; CPE, Cytopathic effect; EMEM, Eagle's Minimum Essential Medium; FBS, Fetal bovine serum; MOI, Multiplicity of infection; PIV, Parainfluenza virus

Material Citation

If use of this material results in a scientific publication, please cite the material in the following manner: Human parainfluenza virus 3 (ATCC VR-1782)

Warranty

The product is provided 'AS IS' and the viability of ATCC[®] products is warranted for 30 days from the date of shipment, provided that the customer has stored and handled the product according to the information included on the product information sheet, website, and Certificate of Analysis. For living cultures, ATCC lists the media formulation and reagents that have been found to be effective for the product. While other unspecified media and reagents may also produce satisfactory results, a change in the ATCC and/or depositor-recommended protocols may affect the recovery, growth, and/or function of the product. If an alternative medium formulation or reagent is used, the ATCC warranty for viability is no longer valid.
